New experimental figures are given for specific volumes of water and water steam at temperatures of 600°, 620 and 650°C at 70 to 500 atm. The possible reasons for errors in an earlier investigation at temperatures of 620 and 650°C are also examined. (Author)

In the combustion chamber with a conical register and a telescopic flame tube it is possible to burn different types of solar oils, diesel fuels and mazut of type F-12 when it is heated to 100°C. The fuel combustion process was completed in the first section of the combustion chamber (l/d = 0.8). The heat release values for all the fuels burnt were 5×10^6 to 18×10^6 kcal/m^3·h·atm and the specific heat release values

Trans. of Teploenergetika (USSR) 1959 [v. 6] no 6, p. 35-39.

A method is put forward for designing centrifugal pumps fitted with additional axial impellers with values of C_{crit} between 3000 and 4000; the method is based on the use of test data and the similarity of the determining parameters. A nomogram and recommendations are given for choosing the basic constructional relationships and dimensions of such stages. (Author)

Numerous investigations on cavitation erosion have shown that the electrical phenomena and their action on the metal should be taken into account in considering the nature of cavitation erosion. The electric currents set up during cavitation are due to heating of the metal. Cathodic protection can be an effective means of combatting cavitation erosion. (Author)
